

NON-WELDED PIPE REPAIR AND REINFORCEMENT

mc² oilfield services is a trained and certified service agent/applicator of Composi-Sleeve™ pipeline repair projects. Composi-Sleeve™ is a patented pipeline anomaly repair solution that protects and supports pipeline flow. It utilizes a military-grade chemical welding process to repair pipeline anomalies (cracks, dents, corrosion, wall loss and leakage) without taking the pipeline out of service — saving millions of dollars.

The Composi-Sleeve system is a patented non-welded pipe repair and reinforcing system that can be utilized to restore damaged or leaking pipe back to full design strength, add structural integrity and increase the rating of a piping system. It can repair pipeline anomalies such as leaks, dents, gouges and wall loss using a technology developed by Western Specialties LLC. The system has been developed for the pipeline industry emphasizing the non-weld pressure containing repair and reinforcement system.

The Composi-Sleeve application is an ideal solution for a non-welded pressure containing added structural support for pipeline spans over rivers, crossings and washes.
